Sensitivity Analysis & Duality

Tables and Chairs (painting = 1300)

A shop produces tables (T) and chairs (C). Maximize profit subject to carpentry and painting hours, a market limit on chairs, and a minimum number of tables.

Source: Lecture slides 6-19 (graphical sensitivity analysis)

Problem type	MAX, 2 variables, 4 constraints
Status	OPTIMAL
Optimal Profit (\$)	4,820
Dual status	OPTIMAL
Prepared by	Dr. Islam Ali
Course	Sensitivity Analysis and Duality (Dr. Islam Ali)
Date	27 September 2026, 15:11

1. Model formulation

MAX $z = 7T + 5C$
 subject to
 $3T + 4C \leq 2400$ (Carpentry)
 $2T + C \leq 1300$ (Painting)
 $C \leq 450$ (MaxChairs)
 $T \geq 100$ (MinTables)
 $T \geq 0, C \geq 0$

Data table

Constraint	T	C	Sense	RHS
Carpentry	3	4	$\leq$	2,400
Painting	2	1	$\leq$	1,300
MaxChairs	0	1	$\leq$	450
MinTables	1	0	$\geq$	100
Objective c	7	5	max	—

Definitions

- **T**: number of tables produced
- **C**: number of chairs produced
- **Carpentry**: carpentry hours available
- **Painting**: painting hours available
- **MaxChairs**: maximum number of chairs
- **MinTables**: minimum number of tables

2. Optimal solution

Optimal Profit (\$): **4,820**

Variable	Description	Optimal value	Obj. coefficient	Contribution
T	number of tables produced	560	7	3,920
C	number of chairs produced	180	5	900

Constraint	LHS	Sense	RHS	Slack/Surplus	Binding
Carpentry	2,400	<=	2,400	0	yes
Painting	1,300	<=	1,300	0	yes
MaxChairs	180	<=	450	270	no
MinTables	560	>=	100	460	no

Corner points

T	C	Profit (\$)	Optimal?
100	0	700	
650	0	4,550	
560	180	4,820	✓
200	450	3,650	
100	450	2,950	

3. Sensitivity analysis

Objective-coefficient ranging (variable cells)

Variable	Value	Reduced cost	Obj. coef	Allow. +	Allow. –	Low	High
T	560	0	7	3	3.25	3.75	10
C	180	0	5	4.333	1.5	3.5	9.333

Right-hand-side ranging (constraints)

Constraint	LHS	Sense	RHS	Slack	Shadow price	Allow. +	Allow. –	Low	High
Carpentry	2,400	<=	2,400	0	0.6	675	450	1,950	3,075
Painting	1,300	<=	1,300	0	2.6	300	450	850	1,600
MaxChairs	180	<=	450	270	0	∞	270	180	∞
MinTables	560	>=	100	460	0	460	∞	$-\infty$	560

Interpretation

- **T = 560.** Its objective coefficient (7) may vary in [3.75, 10] without changing the optimal solution (one change at a time).
- **C = 180.** Its objective coefficient (5) may vary in [3.5, 9.333] without changing the optimal solution (one change at a time).
- **Carpentry** is binding. Shadow price 0.6: each extra unit of RHS changes Profit (\$) by 0.6, valid while the RHS stays in [1,950, 3,075].
- **Painting** is binding. Shadow price 2.6: each extra unit of RHS changes Profit (\$) by 2.6, valid while the RHS stays in [850, 1,600].
- **MaxChairs** is not binding (slack 270), so its shadow price is 0; the RHS can move within [180, ∞] without effect on Profit (\$).
- **MinTables** is not binding (slack 460), so its shadow price is 0; the RHS can move within [$-\infty$, 560] without effect on Profit (\$).

Sensitivity dashboard

Tables and Chairs (painting = 1300): sensitivity dashboard ($z^* = 4,820$)

Optimal corner for every objective vector

4. Parametric analysis

Each chart re-solves the LP for a range of values of one coefficient. The shaded band is the range reported in section 3.

5. What-if scenarios

'Predicted' uses only the sensitivity report (shown when the change is inside its range); 'Actual' re-solves the LP.

Scenario	InRange	Predicted	Actual	NewSolution	Note
c(T): 7 → 8	yes	5,380	5,380	560, 180	slide 8/10: profit per table 7 → 8
c(T): 7 → 11	no	–	7,150	650, 0	slide 11: profit per table 11
c(T): 7 → 3	no	–	2,850	200, 450	slide 11: profit per table 3
b(Painting): 1300 → 1300	yes	4,820	4,820	560, 180	slide 14/16: painting hours 1000 → 1300

Changing an objective coefficient rotates the iso-profit line; the feasible region never moves

Painting: RHS 1300 → 1300

6. Duality

Dual formulation

MIN $z = 2400 y_{\text{Carpentry}} + 1300 y_{\text{Painting}} + 450 y_{\text{MaxChairs}} + 100 y_{\text{MinTables}}$
 subject to
 $3 y_{\text{Carpentry}} + 2 y_{\text{Painting}} + y_{\text{MinTables}} \geq 7 \quad (\text{T})$
 $4 y_{\text{Carpentry}} + y_{\text{Painting}} + y_{\text{MaxChairs}} \geq 5 \quad (\text{C})$
 $y_{\text{Carpentry}} \geq 0, y_{\text{Painting}} \geq 0, y_{\text{MaxChairs}} \geq 0, y_{\text{MinTables}} \leq 0$

Dual solution (resource / requirement prices)

Dual variable	Primal constraint	Value y^*	Primal shadow price	$b_i \cdot y_i$
$y_{\text{Carpentry}}$	Carpentry	0.6	0.6	1,440
y_{Painting}	Painting	2.6	2.6	3,380
$y_{\text{MaxChairs}}$	MaxChairs	0	0	0
$y_{\text{MinTables}}$	MinTables	0	0	0

Strong duality check: primal $z^* = 4,820$, dual $w^* = 4,820$ (equal ✓). Dual of the dual equals the primal: yes.

Complementary slackness (all products must be 0)

Pair	Slack	DualValue	Product
Carpentry slack $\times y_{\text{Carpentry}}$	0	0.6	0
Painting slack $\times y_{\text{Painting}}$	0	2.6	0
MaxChairs slack $\times y_{\text{MaxChairs}}$	270	0	0
MinTables slack $\times y_{\text{MinTables}}$	460	0	0
$T \times \text{surplus of dual constraint T}$	0	560	0
$C \times \text{surplus of dual constraint C}$	0	180	0

Dual constraints: value of resources in each product vs its objective coefficient

Primal (max): 4 constraints × 2 variables

7	5	← objective
3	4	≤ 2400
2	1	≤ 1300
0	1	≤ 450
1	0	≥ 100
T	C	

Dual (min): 2 constraints × 4 variables

2400	1300	450	100	← objective
3	2	0	1	≥ 7
4	1	1	0	≥ 5
y_Carpentry	y_Painting	y_MaxChairs	y_MinTables	

Graphical view of the primal
